Course Project, Spring 2016

Cluster-State Quantum Computing

Mayra Amezcua, Dileep V. Reddy, Zach Schmidt

May 25, 2016

CIS410/510 Introduction to Quantum Information Theory
Lecturer: Prof. Xiaodi Wu
Computer and Information Science, University of Oregon

Table of Contents (optional frame. Can delete.)

1. Motivation
   - Gates through teleportation
2. Cluster states (CS)
   - Definition
   - Representations
   - Properties
3. Universal computation through CS
   - Linear wire
   - Arbitrary single qubit operations
   - Two qubit operations
4. Advantages and disadvantages
   - Parallelizability
   - Experimental implementations
   - CS model as an analysis tool
5. References

template frame (delete me)

Arbitrary quantum circuit involving unitary operations on 3 qubits.

One-way quantum computing, measurement based quantum computing
As opposed to circuit based quantum computing

Basic teleporation

Cluster states form a class of multiparty entangled quantum states which belong to the larger set of so-called graph states.

Examples of graph states:

- *Bell states*
- *Greenberger-Horne-Zeilinger (GHZ) states*
- *states that appear in quantum error correction*

Intuitively, graph states can be thought of as multi-qubit states that can be represented by a graph.

- Each qubit is represented by a vertex of the graph
- An edge between vertices represents an interacting pair of qubits

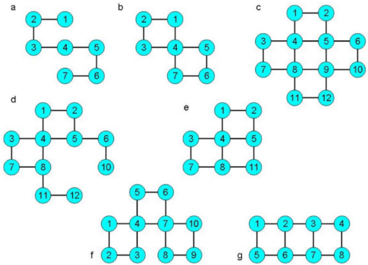

Figure: Figure showing representative 2-D cluster shapes. The vertices are qubits with integer indices, and the edges indicate entanglement connectivity between select neighbors.

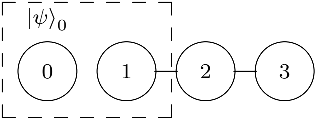
Blah

The spacial layout of the graph representation of the cluster state plays a role in the computational power of that state.

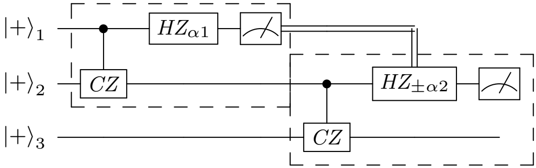
Operations on a linearly prepared cluster state can be efficiently simulated on a classical computer in $O(n \log^c(1/n))$, where n is the initial number of qubits, and c is the cost of floating point multiplication [Nielsen, 2006].

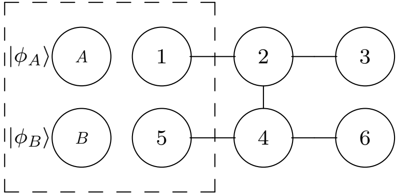
In general, measurement based models can be polynomial time reduced to the gate array model, and thus have the same power, but they are more easily parallelizable [Jozsa, 2006].



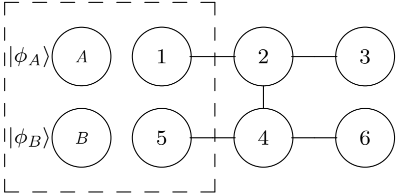
Gate $C_z^{(0,1)}$, followed by measurements $M_X^{(0)}$, $M_X^{(1)}$, & $M_X^{(2)}$.

Callback to teleportation discussion





Apply $C_z^{(A,1)}$ and $C_z^{(B,5)}$ to input quantum information into cluster state.



Apply $C_z^{(A,1)}$ and $C_z^{(B,5)}$ to input quantum information into cluster state.
